Subject: Douglas-fir Tussock Moth Pheromone Detection Survey 2002 Report (NE03-02)

To: Forest Supervisors: Eldorado, Inyo, Lassen, Plumas, Modoc, Sierra, Stanislaus, Sequoia and Tahoe National Forests and the Lake Tahoe Basin Management Unit

Enclosed are the results of the 2002 cooperative Douglas-fir tussock moth (DFTM) pheromone detection survey. Average trap catches for 2002 showed decreases for a most plots compared to 2001 catches (Table 1). Data were collected for 168 plots (5 traps/plot) during 2002 resulting in 162 plots (96%) with an average of <25 males per trap and the remaining 6 plots (4%) averaging 25 or more moths per trap. Plots that averaged >25 moths per trap for 2002 were located on the following Ranger Districts: Placerville (Eldorado NF), Bass Lake (Sierra NF), and Nevada City (Tahoe NF). In addition to these plots monitored on National Forest lands there was one plot that exceeded 25 moths/trap in Yosemite National Park, near Henness Ridge, southwest of Chinquapin in Mariposa Co.

Increases and declines in trap counts are very common with DFTM populations. Based on the results of the 2002 monitoring, significant activity by DFTM is not anticipated within the plot system area during 2003. During the field season of this year Forest Health Protection will monitor other life stages in the areas where DFTM activity exceeded an average of 25 males/trap. Field going personnel are urged to continue to check for evidence of feeding and defoliation on white fir throughout the susceptible host type this summer and fall.

Sufficient trapping materials have been ordered for the detection survey plots for 2003. They will be distributed to cooperators in June or July of this year. Please direct any questions and/or observations of feeding or defoliation to Sheri Smith (530-252-6667) or John Wenz at (209-532-3671). Updates on population monitoring will be distributed to land managers as needed. FHP appreciates the continued cooperation from all agencies in this ongoing west-wide survey effort.
